### Error: Cannot find machine.dba

#### Issue

The message “Can not find machine.dba” is displayed repeatedly when using the CybraryN™ software.

#### Cause

The CybraryN™ software looks for the file **machine.dba** in the **CybraryN™ patron system file location** specified in the CybraryN™ software setup. If this path does not contain the machine.dba file, the error message will be displayed when the software tries to refresh the list of available computers.

#### Solution

1. Start the CybraryN™ software.
2. Select **File > Setup** from the menu.
3. Click the **Browse** button next to the **CybraryN™ patron system file location**.
4. Select the network location where the CybraryN™ software stores its **Patron system files**. (If you are unsure of this location, open the CybraryN™ software setup on a workstation and select the **Files** tab. Use the network location displayed in the “Patron System File Location” field.)
5. Select **OK**.
6. Exit CybraryN™ software to save the settings.
