

### How to use Logchopper:

1. Copy the file **Chopper.exe** into the folder containing login.dba, logout.dba, and meter.dba.
2. Double-click **Chopper.exe** to run it.
3. Click the **Start** button.
4. Wait until a message box pops up saying “File Processing Complete” and then click the **Close** button.
5. You will now have folders for every year, which contain subfolders for each month. Each month subfolder contains “chopped” versions of the three log files, which consist solely of entries from the appropriate month and year.
6. You can now delete the larger versions of these log files.

**NOTE:** You can have **Chopper.exe** start and end automatically (for scheduled tasks) by supplying the command line switch **/A**
