### Delay Startup of CybraryN™ Software until a network connection has been made

#### Software

This information applies to:

- CybraryN™ software

#### Issue

The **Slowstart.exe** utility will delay the loading of the CybraryN™ Software until a network connection is available.

#### Solution

1. Use Notepad to create a file with the following information:

```
<<path to slowstart.exe>> <<network path to check\>>,<<full path to tdmenu.exe>>
```

A sample file might look like this:

```
C:\tdmenu\slowstart.exe \\myserver\path\C:\tdmenu\tdmenu.exe
```

This file should be saved as **slowstart.bat** and scheduled to run on machine startup.

2. Using the Windows Scheduled Task Dialog box, add a new scheduled task and choose **slowstart.bat** to run each time the machine starts up.
3. Start CybraryN™ software, go into the **Admin** tab in Setup and make sure the option **Start CybraryN when Windows starts** is NOT checked. The SlowStart utility will start CybraryN™ software.

If you do not have the SlowStart utility, contact CybraryN™ Technical Support to obtain the necessary files.
